An Introduction To Mass Spectrometry (MS)

For Complete  Confidence

©20

- Mass spectrometry is an analytical tool used for measuring the **molecular mass** of a sample **but it is capable of much more**, as we shall see !
- For **large molecules** such as **biomolecules**, molecular masses can be **measured to better than 0.01% i.e.** within a **4 Daltons (Da)** for a sample of **40,000 Da**.
- This **allows minor mass changes** to be **detected**, *e.g.* the **substitution** of one amino acid for another, or a post-translational **modification**.

- For **small molecules** (< 900 Da) the molecular mass can be measured to within an accuracy of **5 ppm or less**,
- This is often **sufficient to confirm** the **molecular formula** of a compound, and is also a standard requirement for **publication** and **patent submission**.

- **Structural information** can be generated using certain types of mass spectrometers, usually those with multiple analysers which are known as **tandem mass spectrometers**.
- This is **achieved** by **fragmenting** the sample **inside the instrument** and **analysing the products** generated.
- This procedure is useful for the structural elucidation of **organic compounds, peptide** or **oligonucleotide sequencing**.

- Mass spectrometers determine the molecular weight of a compound which facilitates the:
 - Determination of **modifications** and **substitutions** of intact **proteins**
 - Determination of **protein complex stoichiometry**
 - Determination of **elemental compositions**
 - Determination of **peptide** and **carbohydrate sequences**
 - **Structural Elucidation**
 - **Detection** of compounds at low levels (**femtomole sensitivity**)
 - **Quantification** of target compounds (diagnostics, monitoring)
 - Much much more (biomarkers, purity, clinical) !

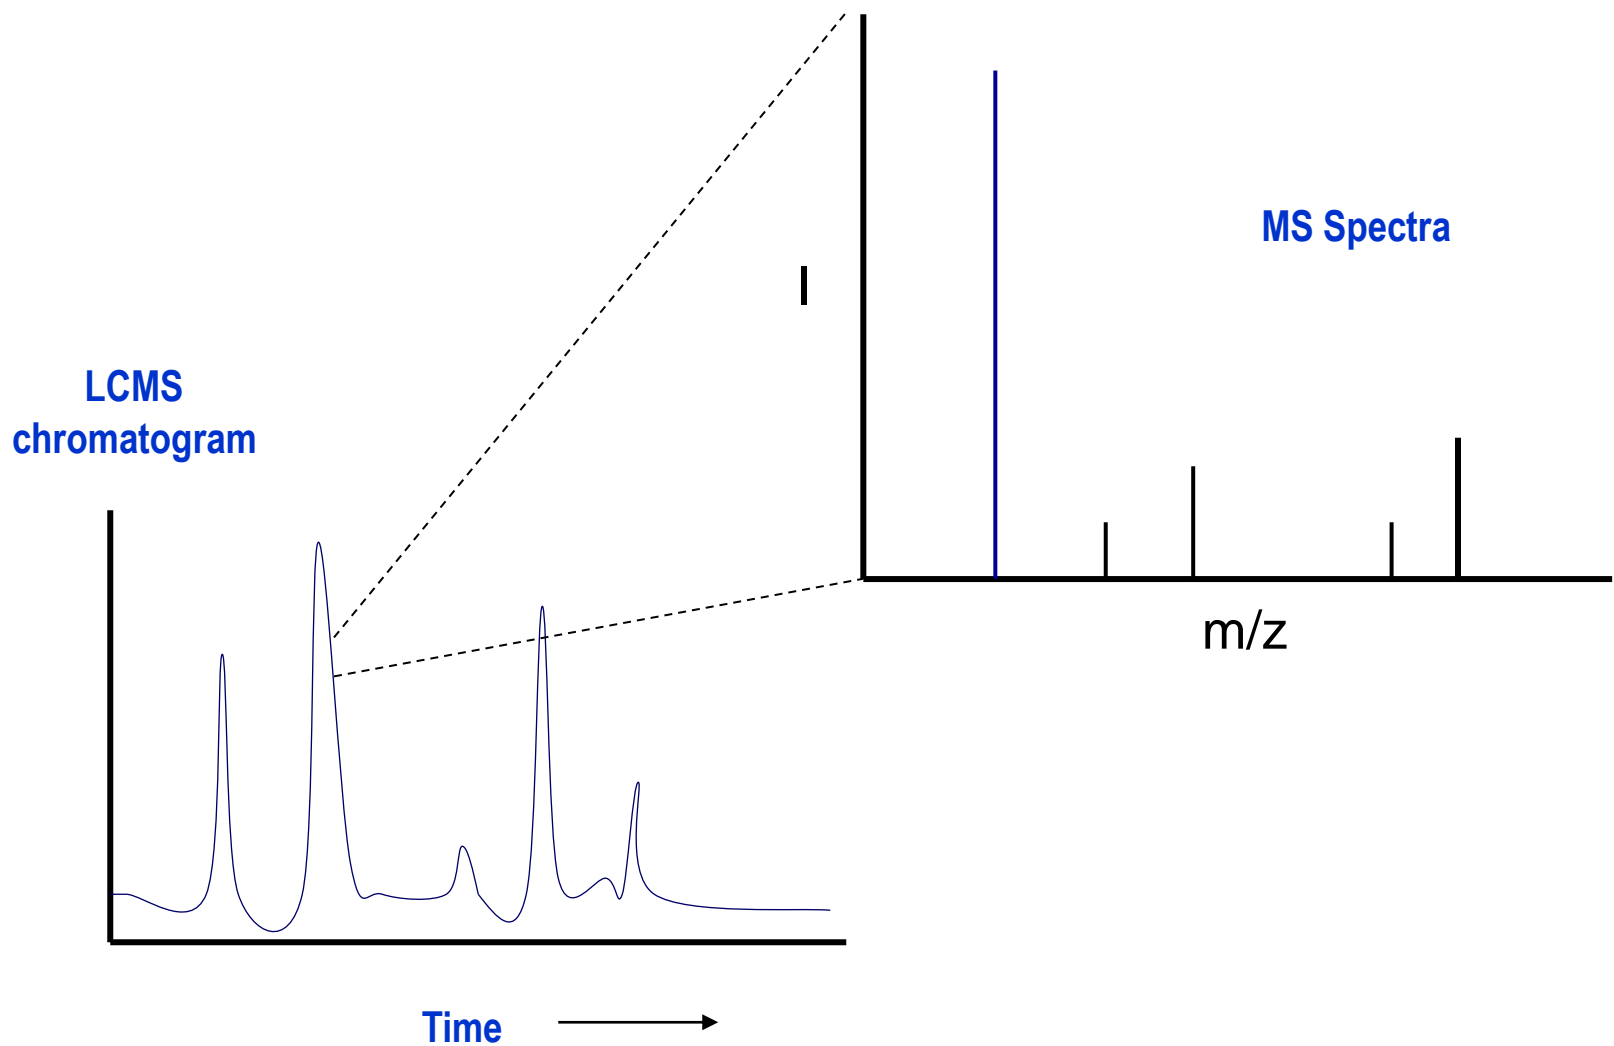

Types Of Mass Spectrometer

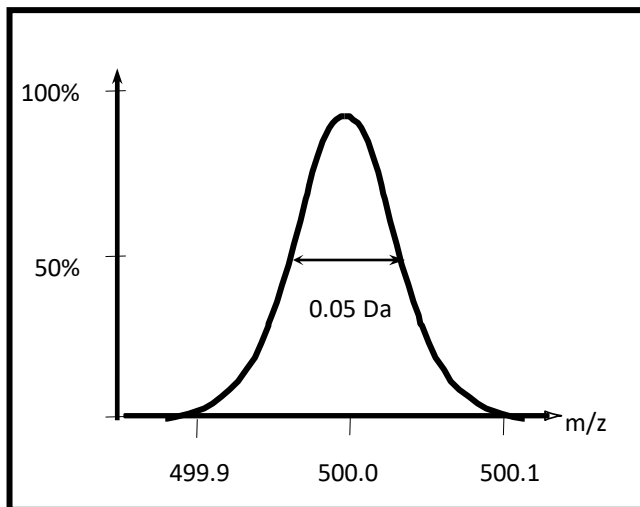

For Complete  Confidence

- There are many types of mass spectrometer
 - Quadrupole
 - Ion Trap (3D and 2D)
 - Tandem Quadrupole
 - TOF (axial and orthogonal)
 - TOF/TOF
 - FT ICR/Magnetic/Electrostatic Instrument
 - Q-TOF
 - Each has its benefits but no one instrument is superior in every way to the rest and so...
 - Depending on the application and performance criteria an instrument can be chosen.
- Low Resolution
- High Resolution
- 

There are several **Classical Performance Criteria**

- Sensitivity
- Dynamic Range
- Resolution
- Mass Accuracy

Mass = 500

Peak width (@ 50%) = 0.05Da

Resolution (FWHM) = $\frac{500}{0.05} = 10000$

FWHM = Full Width Half Maximum

©2005 Waters Corporation

- Quadrupole resolution (quads, traps etc) is not sufficient to differentiate these two compounds
- data with a higher resolving power of (>10,000) clearly shows two distinct peaks.

(c)1998
Kremer Paul

- Every element found in nature has a unique mass
- Elements are combined to produce compounds with distinct masses and physical properties
- Compounds can be detected by mass spectrometry and thus their masses measured
- If a compound mass can be measured with sufficient accuracy, a unique elemental composition can be inferred – the benefit of exact mass

- carbon has a mass of 12
 - hydrogen has a mass of 1
 - oxygen has a mass of 16
 - nitrogen has a mass of 14
-
- But this is not strictly true

- carbon has a mass of 12.0000
- hydrogen has a mass of 1.0078
- oxygen has a mass of 15.9949
- nitrogen has a mass of 14.0031

- It is possible to have combinations of atoms which have the same nominal (or integer) mass but different accurate mass
- If such compounds can be mass measured with sufficient accuracy it is possible to determine elemental composition

©2005 Waters Corporation

- CO = 27.9949
- N₂ = 28.0061
- C₂H₄ = 28.0313

- These elemental combinations have the same **nominal mass** but different **exact mass**
- A nominal mass measurement cannot distinguish these
- If any **compounds differ** in their elemental compositions by substitution of any of **these elements**, then the **exact mass measurement will show this**

- The **accuracy** of the **measurement** is quoted as the **difference** (error) between the measured mass and the calculated mass
- The accuracy is measured in
 - **milliDaltons** (1mDa = 0.001 mass units)
 - **ppm** = parts per million = $\Delta m/m \times 10^6$

Example:

True' mass = 400.0000

Measured mass = 400.0020

Difference = 0.0020 (2 mDa)

$$\text{ppm error} = \frac{0.002}{400} \times 10^6 = 5 \text{ ppm}$$

- Measurement of **mass to 4 decimal places**
- High confidence in **confirming expected compounds**
 - Distinguishes them from compounds of similar mass
- **Compound identification**
 - Prediction of elemental composition
- **Patent submission and publication**
 - ACS require better than 5ppm mass accuracy for publication

- Mass spectrometric technology **advances** typically relate to **performance characteristics** (sensitivity, resolution, mass accuracy etc.)
- These characteristics although **indicative** of the **data quality** and therefore the **information content** that can be **acquired** by the mass spectrometer are **not necessarily guarantees** of the **data quality** and **information content** that is **actually acquired**.
- Advanced **software** has now become a **key performance characteristic** of MS instrumentation (**guaranteeing data quality**, **simplifying** application processes, facilitating the **extraction** of knowledge)

An Introduction To The Current Capabilities Of MS

Proteasome 20S

Composed of 28 subunits arranged in four heptameric, tightly stacked, rings (α 7, β 7, β 7, α 7) to form a cylindrical structure.

685 kDa

Xyloglucan endotransglycosylases (XET, EC 2.4.1.207) are unique enzymes that perform an endolytic cleavage of a xyloglucan chain. This activity has been proposed to play a major role in the transient cell wall loosening required for cell wall expansion.

Recent evidence suggests that XET activity may also contribute to reinforcing the connections between primary and secondary cell walls in wood-forming tissues.

Populus tremula x tremuloides Xyloglucan Endotransglycosylase 16A (PttXET16A E85A). Glycosylation of this enzyme is heterogeneous
